M 2 :- Practical-3

Roll No.:T017	Name: Radhika mali
Class:TYIT	Batch:1
Date of Assignment: 2-9-2026	Date/Time of Submission: 2-9-2026

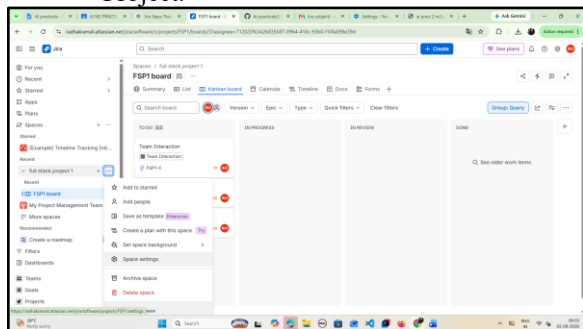

3A) Create and Configure Issue Types

Theory:

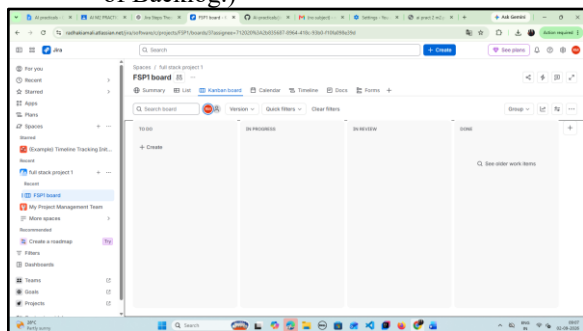

Jira uses different **issue types** to represent different kinds of work in a project. Issue types help the team organize and identify the work clearly. In this practical, we create **Task, Bug and Epic** issue types. The Kanban board provides a visual representation of the work and its current stage.

Steps:

1. Open the **FSP1 board** of the Full Stack Project.

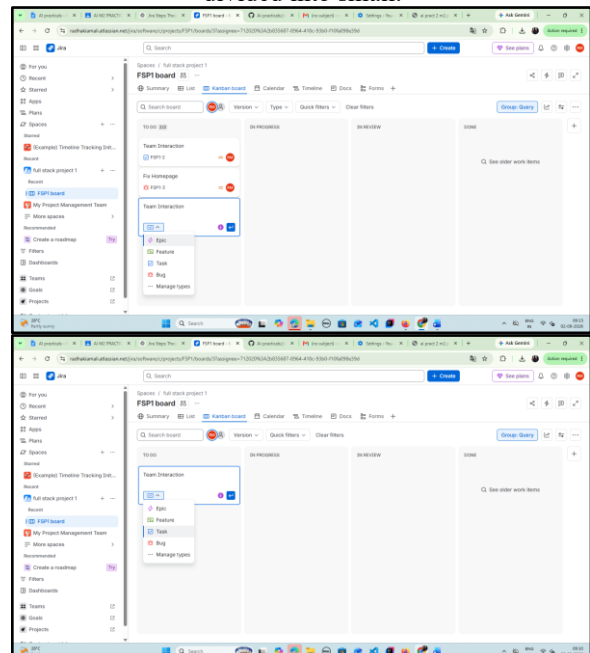

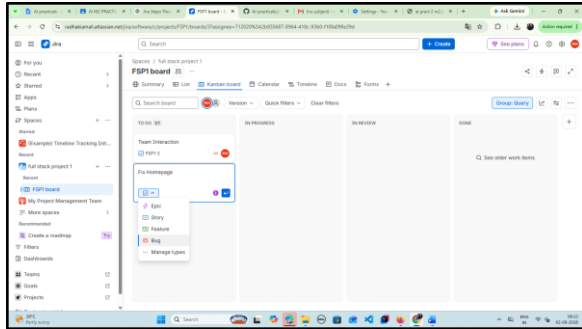

2. Go to the **TO DO** column on your board. (Your Jira interface shows TO DO instead of Backlog.)

3. Click + Create.
4. Enter the work name in What needs to be done?
5. Click the Issue Type dropdown.
6. Select Task for a normal activity.
7. Enter Team Interaction.
8. Press Enter/Create.
9. The Task will appear on the board.
10. Again click + Create.
11. Enter Fix Homepage.
12. Select Bug as the issue type.

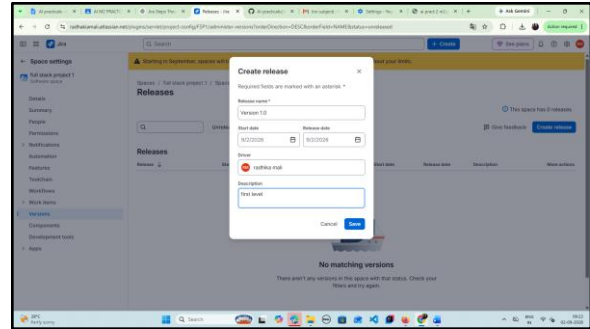

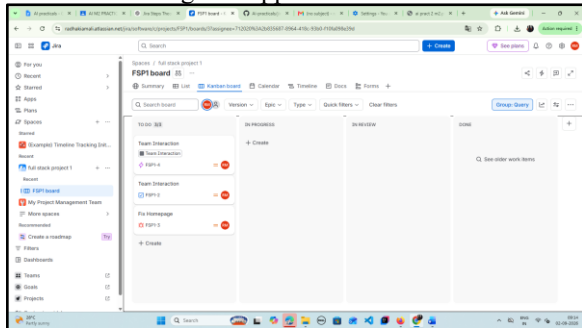

- **Task:** A Task represents a specific piece of work that needs to be completed.
- **Bug:** A Bug represents a problem, error, or defect that needs to be fixed.
- **Epic:** An Epic represents a large body of work that can contain or be divided into small.

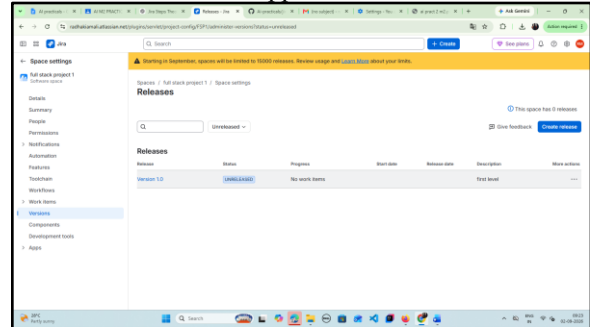

13. Press **Enter/Create**.

14. The Bug will appear on the board.

6. Versions will appear in the list.

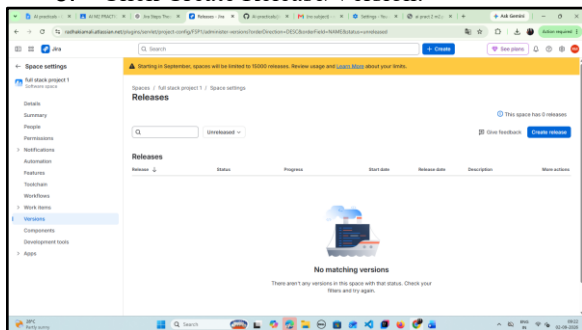

3B) Create Components and Versions

Theory:

Version and Component are used to organize project work. A version represents a particular release or stage of the project, while a component represents a specific part of the project. In this practical, we create a release/version first and then create a component.

Step: Create Version

1. Open Space Settings.
2. Click Versions.
3. Click Create Release/Version.

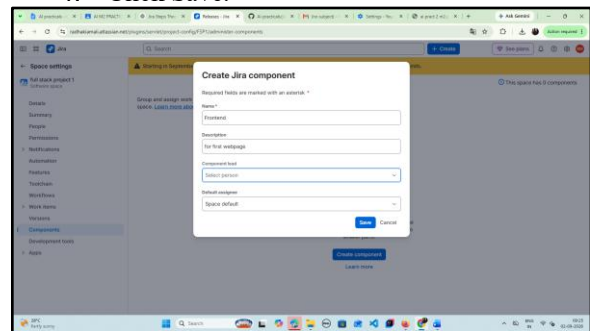

4. Enter version details.

5. Click Save.

Create Component

Step:

1. Open Components.
2. Click Create Component.
3. Enter component details.
4. Click Save.

5. Components will appear in the list.
